

## UNIMARINE GROUP ENVIRONMENTAL SUSTAINABILITY

When it comes to the Environmental sustainability, the Unimarine Group is proud to say that we were the first company in our field who introduced to the market the Replacement of Solvent products with water based strong cleaners.

This achievement started in 1993 and continues until today with even stronger efforts to Protect our world Eco systems and our society and finally our employees and business partners, users of our products.

Our Marine and Offshore industry is IMO driven industry, and the environment is the number One priority. As a result of this, our Marine chemicals should follow the IMO regulations to be a serious supplier in the field.

Our raw materials are produced by major chemical companies like BASF, Dupont, Dow who have a commitment to achieve best environmental goals.

On every occasion where IMO change the raw materials in their Enviro accepted list of products, Unimarine is immediately changing the formulation of products using the alternative acceptable raw materials.

In such occasions, the Economy which is one of the Three principals of Sustainability goals, is also playing a major role in the above process and Unimarine is always trying to balance the profit with the enviro protection.

As one of our major priorities is the safety on board and the protection of the Crew, we always change raw materials which are forbidden in the market with new safe ones. As an example, we do not supply any more Hydrazine for Boiler treatment since it was replaced already for 10 years ago the whole BWT line with enviro products.

Our procedure for quality checking on our worldwide blenders and business partners is very strict and our commitment is to protect worldwide on environmental developments.

The packaging and the reducing of plastics are one of our goals and we are already using packaging companies who use reusable plastics and have recycling principals.

Unimarine protects our environment and our clients- users by different ways where some of them are mentioned below.

- Design safer Chemicals and product.
- Prevent waste.
- Design less dangerous synthesis – formulas.
- Use renewable Feed stocks.
- Use Safer Solvents.
- Minimize potential accidents.

In Unimarine we always care about our blue world and our slogan:

Clean ships ...clean seas .. is already a practice for 40 years.
